

Just Get it Written: Deploying Applications to OC4J Using JDeveloper and EM

Peter Koletzke
Technical Director &
Principal Instructor

I Heard Him Say This

Putting application software
on your PC is a bad idea ...
It's my fault.
We sold it to you. Sorry.

— Larry Ellison, CEO Oracle Corp.,
Oracle OpenWorld 1999

Preparation for Deployment

- Development and testing complete
- Required libraries identified
- Application server is available
 - Has an appropriate web container (JVM) process
 - For example, OC4J for JSP or UIX
 - You know the server administration password
 - Or know someone who knows
 - Needed to copy files to the server

Deployment Objectives

- Ensure that all required libraries are available
- Ensure that library versions match between development and deployment
- All JDev projects needed must be deployed
 - Model
 - ViewController
- Files must be archived into specially formatted J2EE JAR files
 - WAR
 - EAR (if more than one application)

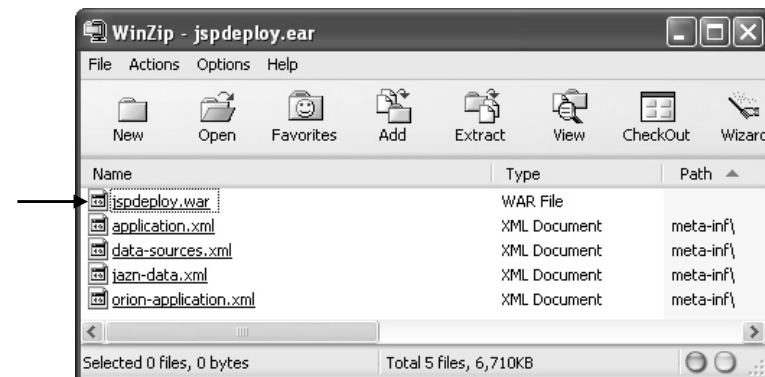

Enterprise Application Archive (EAR)

- Contains one or more WAR (application) files
- A file you deploy
- Copy to the app server directory:
OC4J_HOME/j2ee/home/applications
 - App server processes new EAR files when restarting
 - Can also process EAR files without restarting
- The app server expands this into its component WAR files
 - Each WAR file goes into a directory corresponding to its name
 - Then it expands the WAR files

Sample EAR File

- One app (WAR) file in this case
- Several XML configuration files

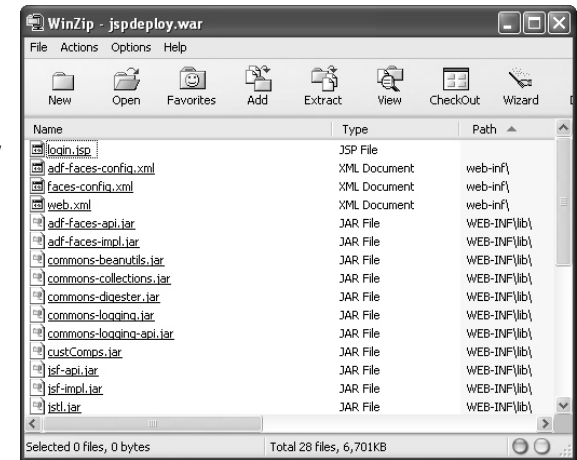

Web Application Archive (WAR)

- Also called, *Web Archive*
- Can alternatively be deployed without an EAR
- Contains all files required for an application
- Contains files or directories inside WEB-INF (the main runtime directory)
- Copied to server and expanded into separate files by the server
 - Inside a directory named the same as the WAR file

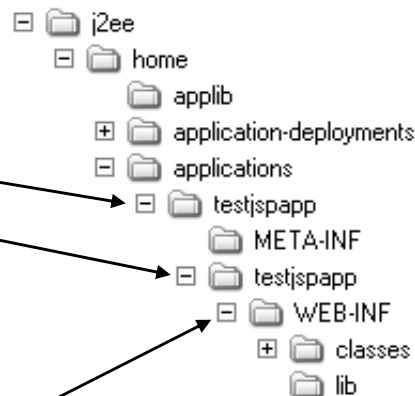

Sample WAR File

- App server extracts files into the `../applications/<app>` directory
 - `<app>` is the name of the WAR file

Deployed Directory Structures

- Directory under `j2ee/home/applications`
- EAR file here
- WAR file here
 - All files in the WAR file expanded into this directory
- Publicly available files in WEB-INF

Web Deployment

- Deployment Concepts
- JDeveloper Support
- Deploying from EM

Two Big Steps

1. Prepare a WAR deployment profile

- Specify what to deploy
 - Application projects
 - ADF BC projects
 - Required libraries

2. Deploy using the deployment profile

- This creates the WAR and EAR
- JDev copies them to the server

Alternative to 2: Prepare the EAR using JDev and copy it to the server using Enterprise Manager (an Oracle iAS utility).

Testing in Standalone OC4J

- Between running the app in JDeveloper and deploying to the server run this test
- You need to set up the OC4J standalone instance
 - OC4J is part of Oracle iAS app server
 - Included with JDeveloper for standalone
- Ensure that the OC4J versions are compatible
 - App server vs local standalone

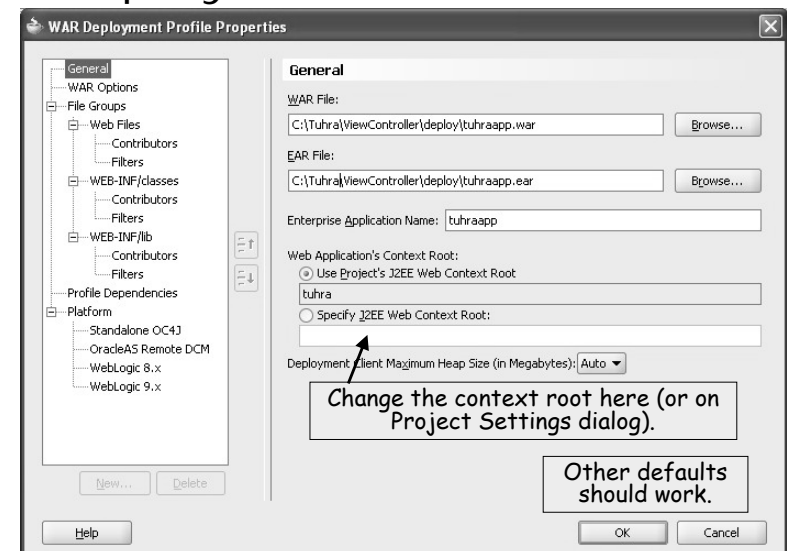

Deployment Profile

- Yet another XML file containing properties
- Select the ViewController project and select WAR File in the New gallery
- This will find dependencies on ADF BC projects and libraries
 - No need to deploy ADF BC projects separately
- New gallery starts the Deployment Profile Wizard
- The profile is visible in the ViewController node for Resources
- Create separate deployment profiles for separate purposes – multiple targets, etc.

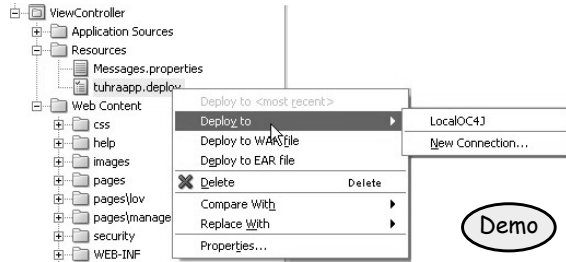

Deployment Profile Wizard

Deploying From JDeveloper

- Assumes OC4J standalone has been set up and is running and the JDeveloper app server connection is set up
 - See hands-on practice for those steps
- Deploy to | <app server connection> from right-click menu on the deployment profile

What Next?

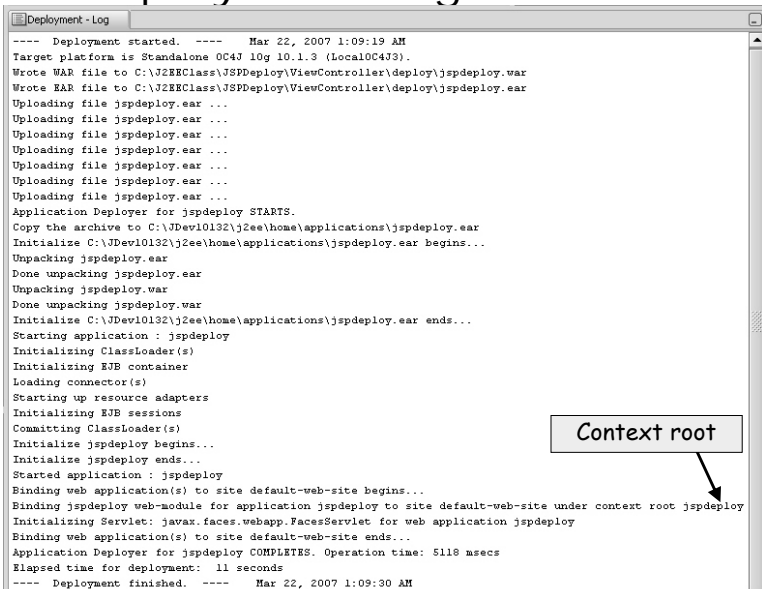

- Wait and watch
 - JDeveloper will build the WAR and EAR files in the project directory

```
---- Deployment started. ---- Mar 22, 2007 1:09:19 AM
Target platform is Standalone OC4J 10g 10.1.3 (LocalOC4J3).
Wrote WAR file to C:\J2EEClass\JSPDeploy\ViewController\deploy\jspdeploy.war
Wrote EAR file to C:\J2EEClass\JSPDeploy\ViewController\deploy\jspdeploy.ear
```

- Then it copies the WAR file to the server instance
- Message log window will show progress

Deployment Log Window

Context root

Test the Application

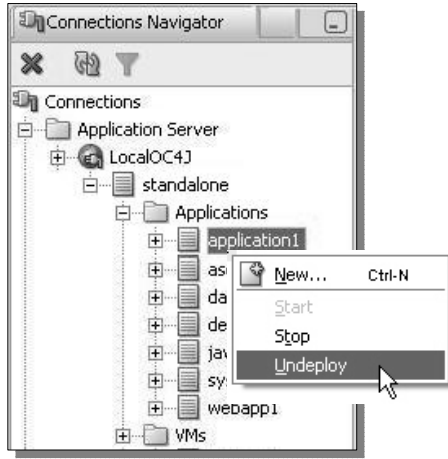

- Close JDeveloper if you are skeptical
- In browser, run the application URL
 - In this case, <http://localhost:8888/jspdeploy>
 - This opens the default page
- Test the app and close the browser
- The EAR file will be deployed to the directory indicated in the Log window

```
Application Deployer for jspdeploy STARTS.
Copy the archive to C:\JDev10132\j2ee\home\applications\jspdeploy.ear
```

Connections Navigator

- The JDev server connection contains a list of deployed applications
- You can act on these using JDeveloper
 - Undeploy
 - Start
 - Stop

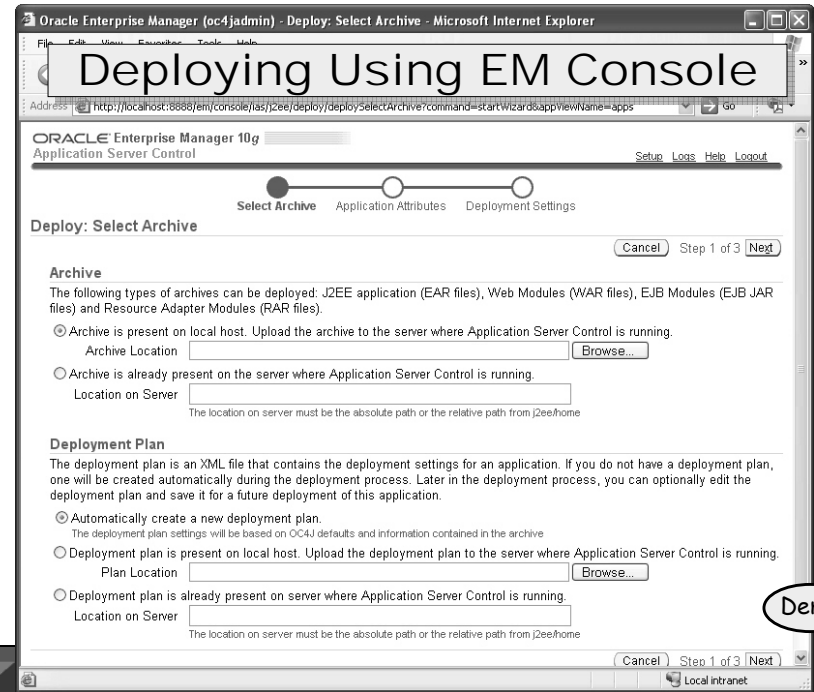

Web Deployment

- Deployment Concepts
- JDeveloper Support
- Deploying from EM

Deploying From EM

- Enterprise Manager is usually under the control of the app server administrator
 - (Be kind to your app server administrator)
- You need to package the EAR file and let them know where it is
 - Select “Deploy to WAR File” from the deployment profile node in the navigator
- The administrator will deploy the EAR file to a new or existing application node
 - Setting up the application is a one-time task
 - Deploying the app after the setup is easier than before the setup

Demo

Tips

- Examine other deployment files
 - orion-application.xml – OC4J-specific
- Always undeploy first
 - You cannot redeploy before undeploying
- Do not do multiple deploys and undeploys in the same OC4J session
- If the deployment fails restart the OC4J instance
- If that fails, restart the app server instance
- If that fails, restart the machine

Summary

- J2EE web applications are deployed to the app server using EAR files
- EAR files contain WAR files
- WAR files contain application files and all required libraries
- JDeveloper's deployment profile helps gather the files
- Run a utility to create the EAR file and deploy to the app server
- Alternatively, use Application Server (EM) Console

Moral

Don't get it right,
just get it written.
